

From the floor to the front-end.

Kyros — what happens when curiosity about AI meets twenty years of retail.

Origin. I run retail for a living. When AI started feeling less like hype and more like a shift, I didn't want to read about it. I wanted to build with it — in the one domain I actually know.

The friction I saw every day. Every store has the same dead minute: the queue. The brand goes quiet. The customer gets bored. The staff starts cold. Three losses in a single moment.

The bet. What if those minutes became the most valuable of the visit? A digital concierge that talks about the brand while you wait — and hands the operator a head start when your turn finally comes.

Chronos is the clock.
Kairos is the right moment.
Kyros is the bridge.

One platform. Two faces. One thread.

A real-time bridge between the back-office and the customer's pocket.

Real stack. Real product.

The Control Room.

Where the experience is conducted.

A unified back-office for managers and operators — designed to scale from a single counter to a national chain.

Live Queue Orchestration

Every ticket, every status, in real time. Concurrent operators never call the same customer twice.

Zones & Entry Points

QR codes generated with embedded labels. NFC-ready. A new store goes live in minutes, not days.

Content Feed Studio

A visual editor with live preview. Push promotions and brand messages directly to waiting customers' phones.

Analytics That Decide

Wait times, throughput, abandonment. The numbers that tell you what to change tomorrow morning.

MULTI-STORE
DATA MODEL

One brand, many stores, dozens of counters — the data model knew it from the first commit.

Designed for one store. Architected for a thousand.

Inside the Control Room.

Three moments from the manager's view.

01 Counter & Queue. One decisive button — and the full waiting pool, store-wide. The operator's home base.

02 Zones & Entry Points. QR generation with embedded labels. NFC-compatible. A store mapped and live in minutes.

03 Analytics. Wait times, throughput, drop-offs. The signal beneath the noise — and the basis for every decision.

From friction to *flow*.

Three pains every customer knows. One quiet fix.

Dead time.

I'm just standing here.

Brand silence.

I came in curious. Nobody's saying anything.

Cold handoff.

Hi, how can I help? — and I start from zero.

Zero-install access.

A QR or an NFC tap. Ticket on your phone in seconds — any device, no signup.

An AI Concierge that knows the brand.

While you wait, ask anything. Real answers, in seconds, in the brand's own voice.

A handoff that means something.

When your turn comes, the operator already knows what you've been thinking about. "Hi, how can I help?" becomes "I heard you were curious about X — let me show you."

The queue stops being the obstacle before the sale. It becomes its starting point.

The customer's view.

Three moments from the phone screen.

01

In the queue.

Live position, estimated time, and a curated feed of brand messages. The wait stays informed, never empty.

02

It's your turn.

A clear, calm, unmistakable signal. No confusion. No missed calls.

03

Thank you.

A graceful close to the loop. The relationship doesn't end at the counter — it begins there.

Connecting the dots.

A retail manager. A curiosity about AI.
A weekend habit that turned into a working product. **Kyros** is what happens when you stop reading about a technology and start using it on the ground you already know.

*I didn't want to predict the future of retail.
I wanted to prototype it.*
